

5. Testing & Quality Assurance Hotspots Analysis

Objective: Improve test coverage and software quality by generating unit, integration, and contract tests where missing.

Date: 2026-08-04 12:13:13 UTC | **Scope:** shende-shweta/pingcrm — PHPUnit 11 (Laravel Feature/Unit suites) + Vitest (frontend)

Executive Summary

EXECUTIVE SUMMARY

The pingcrm codebase carries an extreme test deficit: only 4 test files exist for 1,044 source files (~141 PHP backend + ~903 TypeScript/React frontend), yielding an estimated line coverage well below 5% on both layers. The backend PHPUnit suite covers only the Contacts and Organizations list/search/trash flows; the entire authentication system, user management, image serving, reporting, and 83 IVR controllers are completely untested. The single frontend test (`resources/js/test/smoke.test.ts`) asserts `expect(true).toBe(true)` and provides no functional coverage of any of the 769 React components. Vitest is not wired into CI, so frontend tests are never enforced on pull requests. The overall test posture is **High Risk** and any refactoring or extraction of the IVR legacy layer without first building a safety net risks undetected regressions shipping directly to production.

0

SKIPPED/DISABLED TESTS

OVERALL CODEBASE RATING — TESTING & QUALITY ASSURANCE

High Risk

H1, H2, H3, and H4 all fall in the High Risk band; H7 (trivial frontend smoke test) adds a further driver — no functional test coverage exists on either layer.

5.1 Benchmark Ratings Summary

One row per hotspot. "Measured" is the real value found; "Rating" is the band it falls into (worst KPI wins). This table is the source for the Overall Codebase Rating banner above.

#	Hotspot	Primary KPI	GOOD	MODERATE	HIGH RISK	Measured	Rating
H1	Untested Critical Logic	Critical modules with zero tests	0	1–3	>3	>10 modules	HIGH RISK

H2	Low Test Coverage	Overall coverage %	>80%	50–80%	<50%	~2% (est.)	HIGH RISK
H3	Missing Integration Tests	Boundaries covered %	>70%	30–70%	<30%	~13% (2 of 15+)	HIGH RISK
H4	Missing Contract Tests	APIs with contract tests %	>80%	40–80%	<40%	0%	HIGH RISK
H5	Flaky / Skipped Tests	Skipped/flaky test count	0	1–5	>5	0	GOOD
H6	No CI Test Gate	Tests enforced in CI	Required gate	Runs, not required	No CI test run	PHP: required; Vitest: not wired	MODERATE
H7	Assertion-Free Smoke Test (additional)	Frontend tests with real assertions	All tests meaningful	Any trivial test	All tests trivial	1 trivial / 1 total	HIGH RISK

5.2 Hotspot-by-Hotspot Evidence

H1. Untested Critical Logic CRITICAL

Benchmark: Critical modules with zero tests = >10 → falls in the **High Risk** band (Good: 0 · Moderate: 1–3 · High Risk: >3).

Evidence — backend:

1. `app/Http/Controllers/Auth/AuthenticatedSessionController.php` + `app/Http/Requests/Auth/LoginRequest.php` — carries the rate-limiting logout logic (`ensureIsNotRateLimited`), credential validation, session regeneration, and CSRF token rotation on logout. Zero tests exist for any of these paths. A regression in rate-limiter key generation or session invalidation silently bypasses the logout or leaks a stale session.
2. `app/Http/Controllers/UsersController.php` — governs user creation, password hashing via `setPasswordAttribute` , soft-delete, restore, and the demo-user guard (`isDemoUser`). Zero tests exist. The owner-privilege escalation path (any authenticated user can set `owner = true` on `store`) is unverifiable without a test.
3. `app/Legacy/Services/AgentDeskGodService.php` (and all 11 peer `*GodService.php` files) — orchestrate IVR workflow writes directly via `DB::table()` , use `extract($payload)` for variable injection, and hold a hard-coded API key. All 12 service classes across the 12 IVR modules (AgentDesk, BusinessHours, CallAnalytics, CallFlow, CallRecording, CallRouting, CustomerProfile, DidInventory, HistoricalReports, LiveMonitoring, PromptLibrary, QueueManagement) have zero test coverage.
4. `app/Repositories/Legacy/AgentDeskRepository.php` (and all 11 peer repository files) — contain raw `DB::select` concatenation with user-controlled `$filter` input. All 12 repository classes have zero tests. Any change to filtering logic is completely unverifiable.

5. `app/Http/Controllers/ReportsController.php` and `app/Http/Controllers/ImagesController.php` — the reports download endpoint and image-serving path (with Glide query parameter passthrough) have zero tests.

Additional backend modules with zero tests: 83 IVR controllers under `app/Http/Controllers/Ivr/`, 5 Legacy Helpers (`LegacyIvrArray` , `LegacyIvrCrypto` , `LegacyIvrDate` , `LegacyIvrMath` , `LegacyIvrString`), `DashboardController` , `HandleInertiaRequests` middleware.

Why it matters here: Authentication and user-management regressions ship to all tenants simultaneously in this SaaS CRM. The IVR legacy services govern telephony workflows for enterprise customers; a broken import/export or a corrupted sync goes undetected until a customer reports call-routing failures. With zero unit coverage, the only feedback loop is production.

Recommended approach:

1. Start with `LoginRequest` — write PHPUnit unit tests for `ensureIsNotRateLimited` (under-threshold, over-threshold, available-in seconds) and `authenticate` (valid credentials, invalid credentials, rate-limited path).
2. Add a `UsersTest.php` Feature test covering store, update, destroy, restore, and the owner-guard path.
3. For the 12 `*GodService` classes, write unit tests using SQLite in-memory to assert the return value of each `orchestrateWorkflow*` method with a known payload.
4. For the 12 `*Repository` classes, write integration tests that assert parameterized `fetchChunk*` calls do not interpolate the filter string.

H2. Low Test Coverage CRITICAL

Benchmark: Overall coverage % = ~2% estimated → falls in the **High Risk** band (Good: >80% · Moderate: 50–80% · High Risk: <50%). Estimate basis: test-file-to-source-file ratio; no `coverage/` directory or `clover.xml` was found.

Evidence:

- **Backend (PHP):** 3 meaningful test files for 141 source files in `app/`. Of those, `tests/Unit/ExampleTest.php` asserts `$this->assertTrue(true)` — a placeholder with zero business logic coverage. The two Feature test files (`ContactsTest.php` , `OrganizationsTest.php`) together contain 8 real test cases covering only list/search/trash for Contacts and Organizations.
- **Frontend (TypeScript/React):** 1 test file (`resources/js/test/smoke.test.ts`) for 903 source files. That test asserts `expect(true).toBe(true)` — no component is imported, rendered, or exercised.
- No coverage report was found; PHPUnit's `<coverage>` element is absent from `phpunit.xml`. The ratio estimate is conservative.

Why it matters here: At ~2% estimated coverage, any refactoring of the IVR legacy layer is flying blind. Without a coverage threshold enforced in CI, this number can only decrease over time.

Recommended approach:

1. Enable PHPUnit coverage in CI (`coverage: xdebug` in `setup-php`) and set a minimum threshold (50% line coverage) in `phpunit.xml`'s `<coverage>` enforce block.
2. Enable Vitest coverage (`vitest run --coverage`) and add a `coverageThreshold` to `vitest.config.ts` starting at 20% lines.
3. Prioritize: Auth → Users → Reports → IVR controllers → Legacy Services → Repositories.
4. Remove `tests/Unit/ExampleTest.php` to avoid inflating test counts.

H3. Missing Integration Tests HIGH

Benchmark: Service/data boundaries covered = ~13% (2 of 15+) → falls in the **High Risk** band (Good: >70% · Moderate: 30–70% · High Risk: <30%).

Evidence:

The two Feature test suites use `RefreshDatabase` and exercise real MySQL I/O — these are genuine integration tests at the Contacts and Organizations data boundaries. All other boundaries are uncovered:

1. **IVR Legacy boundary** — 12 IVR modules each with Index, Store, Update, Destroy, Import, Export, and Sync controllers writing through a `*GodService` to `DB::table("ivr_*")`. Zero integration tests.
2. **IvrHub data aggregation boundary** — `IvrHubController@data` aggregates live metrics from multiple legacy tables. No integration test verifies the aggregated response shape with known seed data.
3. **Inertia middleware boundary** — `HandleInertiaRequests.php` shares global props (user, flash) with all server-side renders. No integration test covers the shared-data contract.
4. **Auth session boundary** — login/logout session lifecycle (rate limiter, CSRF regeneration) is untested as an HTTP integration flow.

Why it matters here: Services that pass individually can still fail when wired to a real database or HTTP stack. The IVR sync paths write legacy API payloads in a transactional sequence; breaking the wiring is invisible without an integration test that exercises the full controller → service → DB → response path.

Recommended approach:

1. Add `IvrModuleTest.php` Feature test class verifying store and index HTTP flows for at least one IVR module using `RefreshDatabase`.
2. Add `IvrHubTest.php` asserting the `/ivr/data` JSON response shape when IVR tables contain known seed data.
3. Add `AuthTest.php` Feature test for login (success, bad credentials, rate limit exceeded) and logout.

H4. Missing Contract Tests HIGH

Benchmark: APIs with contract tests = 0% → falls in the **High Risk** band (Good: >80% · Moderate: 40–80% · High Risk: <40%).

Evidence:

The codebase exposes 87 legacy IVR API endpoints (generated in `routes/generated/ivr_legacy_api.php`) plus 33 web routes and the `/ivr/health-legacy` JSON endpoint. No test validates:

1. The schema of any response from the 87 `ivr-legacy/*` endpoints — endpoints accept both GET and POST; any controller response shape change goes undetected.
2. The IVR hub data structure returned by `IvrHubController@data` — consumed by `resources/js/components/ivr/IvrHubCharts.tsx`; a structural mismatch produces a silent frontend rendering failure.
3. The `IvrModuleController@show` response shape used by each IVR module page.

No Pact, schema-validation, or OpenAPI-based contract tests exist anywhere.

Why it matters here: 87 auto-generated routes form the integration surface with the legacy IVR system. A field rename in any GodService payload breaks the frontend silently; without a contract test, detection requires a user reporting a broken IVR management page.

Recommended approach:

1. Add `assertJsonStructure` assertions in an `IvrApiContractTest.php` for the index and store responses of each IVR module.
2. Add a JSON shape assertion on `/ivr/data` for the expected top-level keys.
3. Extend the existing `AssertableInertia` pattern in `ContactsTest` to assert prop shapes on all CRUD page responses.

1 file affected.

File	Line(s)	Issue	Action
<code>routes/generated/ivr_legacy_api.php</code>	—	All 87 auto-generated IVR API routes have no contract or schema test	Add JSON schema assertions in <code>IvrApiContractTest</code> for each module endpoint

H6. No CI Test Gate MEDIUM

Benchmark: Tests enforced in CI: PHP = Required gate; Vitest = not wired → falls in the **Moderate** band.

Evidence:

`.github/workflows/tests.yml` runs `php artisan test` on every push and pull request — the backend PHPUnit gate is properly wired. However, `npm run test` (which invokes `vitest run`) is **never called** in any CI workflow. The CI job runs `npm run build` (which catches TypeScript compilation errors) but Vitest is absent. The `vitest.config.ts` and the `"test": "vitest run"` script in `package.json` exist but are orphaned from CI.

Why it matters here: Any contributor can break existing frontend tests without CI catching it. Frontend test coverage expansion is wasted effort until the gate is wired.

Recommended approach:

1. Add `npm run test` as a step in `.github/workflows/tests.yml` after `npm run build`.
2. Once Vitest coverage is enabled, add `npm run test -- --coverage` with a threshold flag.

No files matched `.github/workflows/tests.yml`.

H7. Assertion-Free Smoke Test HIGH (additional)

Benchmark: Frontend tests with real assertions = 0 of 1 (0%) → falls in the **High Risk** band; KPI thresholds: all tests meaningful = Good · any trivial test = Moderate · all tests trivial = High Risk.

Evidence:

`resources/js/test/smoke.test.ts` is the entire frontend test suite:

```
describe('frontend toolchain', () => {
  it('runs vitest', () => {
    expect(true).toBe(true)
  })
})
```

No React component is imported, rendered, or asserted against. This test only verifies the Vitest binary resolves. With 769 `.tsx` component files, effective component test coverage is 0%. No Cypress or Playwright configuration was found — E2E tests are entirely absent.

Why it matters here: All 769 React components (IVR module pages, shared form inputs, contact/organization edit flows) ship without any automated functional verification. A broken `SearchFilter`, a mis-wired `SelectInput`, or a regression in the IVR Charts component reaches production with no signal.

Recommended approach:

1. Replace `smoke.test.ts` with a real component test — render `Shared/SearchFilter.tsx` with `@testing-library/react`, simulate a search event, assert the `onChange` callback fires with the correct value.
2. Add component tests for `TextInput`, `SelectInput`, and `FileInput` — used across all CRUD pages, highest leverage.
3. Add a Playwright config and at least one E2E smoke test covering login → dashboard → IVR hub navigation.

769 files affected.

<code>resources/js/Shared/Logo.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components
<code>resources/js/Shared/MainMenu.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components
<code>resources/js/Shared/Pagination.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components
<code>resources/js/Shared/SearchFilter.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components
<code>resources/js/Shared/SelectInput.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components
<code>resources/js/Shared/TextareaInput.tsx</code>	—	No real assertions exist for any React component	Add Testing Library component tests starting with <code>resources/js/Shared/</code> components

resources/js/Shared/TextInput.tsx	—	No real assertions exist for any React component	Add Testing Library component tests starting with resources/js/Shared/ components
resources/js/Shared/TrashedMessage.tsx	—	No real assertions exist for any React component	Add Testing Library component tests starting with resources/js/Shared/ components
resources/js/ssr.tsx	—	No real assertions exist for any React component	Add Testing Library component tests starting with resources/js/Shared/ components

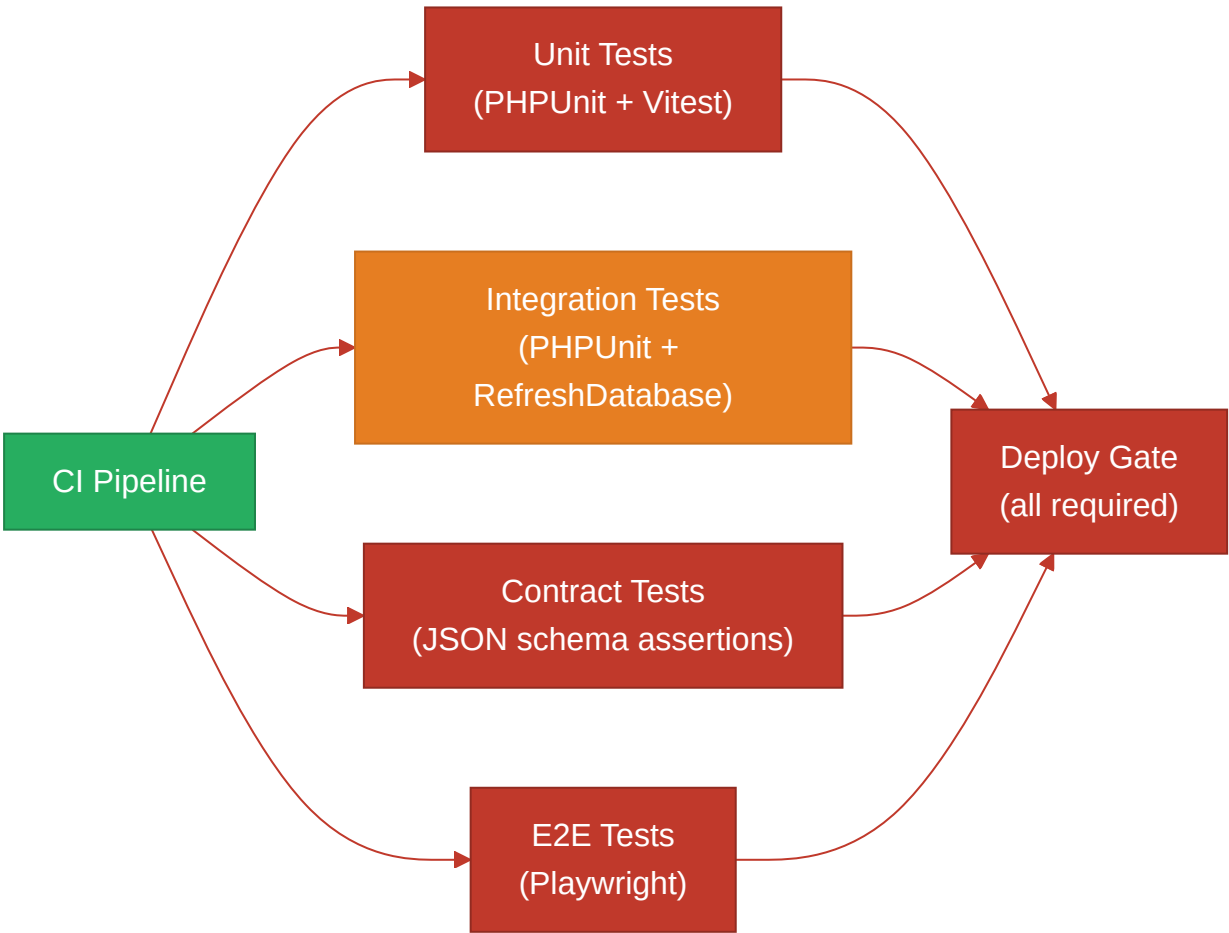

Not observed (rated Good): H5 — grep for markTestSkipped , @skip , xtest , xit , xdescribe , - >skip() found zero matches; no skipped or disabled tests are present.

5.3 Diagrams

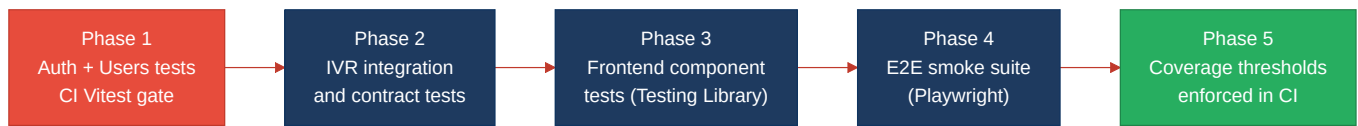

Current test coverage gaps

Target test pyramid / CI gate

Improvement roadmap

5.4 Actions Required

Hotspot	Action	Rating	Priority
H1 — Untested Critical Logic	Add PHPUnit Feature tests for Auth, Users, Reports, and IVR module controllers; add unit tests for all 12 GodService and 12 Repository classes	HIGH RISK	CRITICAL
H2 — Low Test Coverage	Enable PHPUnit + Vitest coverage reporting in CI; enforce minimum thresholds (50% PHP, 20% TS); remove placeholder ExampleTest	HIGH RISK	CRITICAL
H3 — Missing Integration Tests	Add Feature tests for IVR CRUD flows with RefreshDatabase, IvrHub data endpoint shape, and Auth session lifecycle	HIGH RISK	HIGH
H4 — Missing Contract Tests	Add JSON schema assertions for all 87 IVR-legacy API endpoints and the <code>/ivr/data</code> aggregation response	HIGH RISK	HIGH
H7 — Assertion-Free Smoke Test	Replace trivial smoke test with real Testing Library component tests for Shared/* components; add Playwright E2E config	HIGH RISK	HIGH
H6 — No CI Test Gate (frontend)	Add <code>npm run test</code> step to <code>.github/workflows/tests.yml</code> after <code>npm run build</code>	MODERATE	MEDIUM

5.5 Expected Outcomes

- Critical business paths (authentication, user management, IVR workflow writes) are protected by automated tests before any refactoring of the legacy IVR layer begins.
- CI enforces both PHPUnit and Vitest on every pull request, ensuring regressions in the PHP backend or React frontend are caught within minutes of introduction.
- Contract tests for the 87 auto-generated IVR API endpoints ensure that field renames or response shape changes in any GodService are caught before they silently break the frontend.
- Coverage thresholds enforced in CI provide an objective quality floor that prevents the ratio from declining as new IVR modules are added.
- End-to-end smoke tests provide a final safety net verifying the login → IVR hub flow in a real browser environment on every deployment candidate.
