2. Code Quality & Complexity Hotspots Analysis

Objective: Reduce complexity through helper methods, domain services, and the Strategy/Command patterns.

Date: 2026-08-07 11:42:28 UTC | **Scope:** shende-shweta/pingcrm (master) — Laravel 11 / PHP 8.2 backend + React 19 / Inertia / TypeScript frontend

Executive Summary

EXECUTIVE SUMMARY

This codebase is a Ping CRM base (Laravel + Inertia/React) onto which a very large "Legacy IVR" surface has been grafted, and that surface is dominated by copy-paste rather than genuine algorithmic complexity. Coverage spans **both layers**: 141 backend PHP files and 1,051 frontend TypeScript/TSX files (1,192 total). The most severe findings are structural, not branch-depth: the frontend contains 8 files over 1,100 LOC and 133 near-identical `LegacyPass2_*.tsx` pages, while the backend has 82 fat IVR controllers at exactly 759 LOC each, 12 `*GodService` classes, and 12 near-identical repositories — pushing estimated overall duplication well above 60%. By contrast, per-method cyclomatic complexity is genuinely low (max ≈ 8) and no single function exceeds ~22 LOC, so those hotspots rate Good. Git history was available (124 commits, 2020–2026); churn and defect-fix frequency on the maintained core are low, but note that the entire high-risk IVR surface arrived in a single bulk commit — so its near-zero churn is deceptive, not reassuring. Additional backend anti-patterns were confirmed: shared mutable `public static` state in all 12 God services and ~4,940 uses of `extract()` for dynamic variable creation.

~8

HIGHEST CYCLOMATIC
COMPLEXITY

OVERALL CODEBASE RATING — CODE QUALITY & COMPLEXITY

High Risk

Driven by massive duplication (H4/H5), oversized classes/files (H2), and confirmed global mutable state and dynamic-variable anti-patterns (H9/H10); low per-method complexity (H1/H3) and low churn (H6/H7) do not offset the structural debt.

HOTSPOT SCORE (WEIGHTED COMPOSITE)

38 / 100 — Moderate

Hotspot Score = (Cyclomatic Complexity × 25%) + (Code Churn × 25%) + (Defect Density × 20%) + (Class/Function Size × 15%) + (Business Logic Duplication × 10%) + (Developer Ownership Risk × 5%) = (18×0.25) + (15×0.25) + (30×0.20) + (80×0.15) + (92×0.10) + (55×0.05) = 4.5 + 3.75 + 6.0 + 12.0 + 9.2 + 2.75 = 38

NOTE ON THE SCORE VS. OVERALL RATING GAP: the weighted composite lands in **Moderate (38)** because its two heaviest components — Cyclomatic Complexity (25%) and Code Churn (25%) — are both genuinely Good here, mathematically diluting the score. The **Overall Codebase Rating is kept at High Risk** (worst-hotspot rule) because duplication and class size are catastrophic even though they carry lighter composite weights.

2.1 Benchmark Ratings Summary

One row per hotspot. "Measured" is the real value found; "Rating" is the band it falls into (worst KPI wins). This table is the source for the Overall Codebase Rating banner above.

#	Hotspot	Primary KPI	GOOD	MODERATE	HIGH RISK	Measured
H1	High Cyclomatic Complexity	Max complexity per method	<10	10–20	>20	~8 (<code>IvrHubController::loadStats</code>)
H2	Large Classes	Largest class/file LOC	<300	300–1000	>1000	1,101 LOC (frontend); 759 LOC × 82 (backend)
H3	Large Functions	Largest function LOC	<50	50–200	>200	~22 LOC (<code>handleStore</code>)
H4	Business Logic Duplication	Duplicated business logic %	<5%	5–10%	>10%	~60% (handlers + workflows copied per module)
H5	Duplicate Code (general)	Overall duplicate code %	<5%	5–10%	>10%	~65% (est., manual — no jscpd/phpcpd configured)
H6	High Churn Areas	Monthly changes (top files)	<5	5–10	>10	~0.35/mo (top file, 27 changes / 78 mo)
H7	Defect-Prone Files	Fix commits (hottest file)	1–3	4–5	>5	3 (<code>Contacts/Index</code>)
H8	Ownership Issues	Top-author ownership %	>80%	60–80%	<60%	43–71% (maintained core files)
H9	Global Mutable State (additional)	Shared mutable static/global holders (target 0)	0	1–3	>3	12 (<code>public static \$sharedRuntimeCache</code>)
H10	Dynamic Variable	<code>extract()</code> /dynamic-var uses (target 0)	0	1–50	>50	~4,940 <code>extract(\$payload)</code> calls

	Creation (additional)					
--	--------------------------	--	--	--	--	--

Additional hotspots: H9 (shared mutable `public static` state — KPI: count of shared mutable static holders, 0 is best; >3 is High Risk because concurrent requests can corrupt shared state) and H10 (dynamic variable creation via `extract()` — KPI: number of `extract()` /dynamic-variable calls, 0 is best; >50 is High Risk because it destroys static analyzability and hides data flow) were both confirmed with real evidence beyond the standard set.

Hotspot Score breakdown

Component	Weight	Sub-score (0–100)	Weighted
Cyclomatic Complexity	25%	18	4.50
Code Churn	25%	15	3.75
Defect Density	20%	30	6.00
Class/Function Size	15%	80	12.00
Business Logic Duplication	10%	92	9.20
Developer Ownership Risk	5%	55	2.75
Hotspot Score	100%		38 / 100

2.2 Hotspot-by-Hotspot Evidence

H2. Large Classes HIGH

Benchmark: Largest class/file LOC = 1,101 (frontend) · 759 × 82 files (backend) → falls in the **High Risk** band (Good <300 · Moderate 300–1000 · High Risk >1000).

Eight frontend utility files exceed 1,000 LOC and are byte-for-byte structural clones of each other; on the backend, all 82 IVR controllers are exactly 759 LOC and each God service is 373 LOC — far above the <300 LOC target.

`resources/js/utils/duplicate/legacyFormatters1.ts:1-60` (1,101 LOC total; files 1–8 identical in shape):

```
// @legacy duplicated util - legacyFormatters1
export function legacyFormatters1_fn_1(input: unknown): string {
  if (input === null || input === undefined) return ''
  return String(input).trim().toUpperCase() + '_1'
}
export function legacyFormatters1_fn_2(input: unknown): string {
  if (input === null || input === undefined) return ''
  return String(input).trim().toUpperCase() + '_2'
}
// ... _fn_3 ... _fn_N, repeated to 1,101 lines
```

`app/Http/Controllers/Ivr/QueueManagementStoreController.php:22-63` (759 LOC; one `handleStore` + 60 `legacyEndpointN` methods per class):

```
public function handleStore(Request $request)
{
    // Fat controller - business rules live here
    $service = new QueueManagementGodService();
    $q = $request->get("q");
    if ($q) {
        $rows = DB::select("select * from ivr_queue_managements where name like '%".$q."%' and tenant_id = ".$this->tenantId);
    } else {
        $rows = QueueManagement::where("tenant_id", $this->tenantId)->get();
    }
    // ... followed by legacyEndpoint1() ... legacyEndpoint60()
```

Why it matters here: A 759-LOC controller replicated 82 times means a single cross-cutting change (auth check, tenant scoping, response shape) must be re-applied in dozens of classes, and reviewers cannot hold any one file in their head. The 1,101-LOC formatter modules bloat the frontend bundle with dead-weight variants of one trivial string transform. Both mix unrelated responsibilities in one unit, the classic Single-Responsibility violation.

Recommended approach:

1. Collapse `legacyFormatters1..8.ts` into a single parameterized `formatLegacy(input, suffix)` helper under `resources/js/utils/` and delete the seven clones.
2. Split each IVR `*Controller.php` into slim single-action controllers that delegate to a domain service (see H4); drop the 60 dead `legacyEndpointN` methods.
3. Move query/response logic out of `handleStore` into a `QueueManagementService` and a Form Request for validation.

82 files affected.

File	Line(s)	Issue	Action
<code>app/Http/Controllers/Ivr/AgentDeskDestroyController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/AgentDeskExportController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/AgentDeskImportController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/AgentDeskIndexController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods

<code>app/Http/Controllers/Ivr/AgentDeskStoreController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/AgentDeskSyncController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/AgentDeskUpdateController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursDestroyController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursExportController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursImportController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursIndexController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursStoreController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods
<code>app/Http/Controllers/Ivr/BusinessHoursSyncController.php</code>	—	Class far exceeds 300 LOC (fat controller: 60+ endpoint methods mixing routing, raw SQL, and business logic in one class)	Split into single-action controllers delegating to a domain service; remove dead legacyEndpoint methods

H4. Business Logic Duplication CRITICAL

Benchmark: Duplicated business-rule code $\approx 60\%$ → falls in the **High Risk** band (Good <5% · Moderate 5–10% · High Risk >10%).

The same store/index/update workflow and the same "orchestrate workflow" body are reimplemented verbatim across every IVR module (12 domains × multiple controllers and services).

`app/Legacy/Services/QueueManagementGodService.php:13-26` — identical
`orchestrate*Workflow` body repeated 40× per class and across all 12 `*GodService` files:

```
public function orchestrateQueueManagementWorkflow1($payload)
{
    extract($payload); // unsafe
    sleep(1); // blocking synchronous remote sync
    self::$sharedRuntimeCache[$tenant_id ?? 1] = $payload;
    return DB::table("ivr_queue_managements")->insertGetId((array) $payload);
}
public function orchestrateQueueManagementWorkflow2($payload)
{ /* identical body */ }
```

`resources/js/components/legacy/WhisperCoachMonolith4.tsx:7-11` — same validate-then-POST
rule copy-pasted across ~230 `*Monolith*.tsx` components:

```
const save = async () => {
    const err = !draft.name ? 'required' : null
    if (err) return alert(err)
    await fetch('/ivr-legacy/whisper-coach/store', { method: 'POST', body:
JSON.stringify({ ...draft, tenant_id: tenantId }), headers: { 'Content-Type':
'application/json' } })
}
```

Why it matters here: A single rule change — e.g. "name is required AND must be unique per tenant" — has to be edited in ~12 God services and ~230 React components; miss one and behavior silently diverges per module. This is the highest-cost defect surface in the repo because bug fixes never stay fixed.

Recommended approach:

1. Extract one `IvrModuleService` (backend) with a single `persist(array $payload)` method and have every module's controller call it.
2. Extract one `useIvrRecordForm(module)` React hook that owns validation + submission, and replace the per-component `save` handlers.
3. Delete the 40 numbered `orchestrate*Workflow*` methods, keeping one parameterized method.

H5. Duplicate Code (general) CRITICAL

Benchmark: Overall duplicate code $\approx$ 65% (manual estimate – no jscpd/phpcpd configured) → falls in the **High Risk** band (Good <5% · Moderate 5–10% · High Risk >10%).

Beyond business logic, whole files are near-identical: 133 `LegacyPass2_*.tsx` pages at 392 LOC each, 8 formatter modules, 12 repositories (`fetchChunk1..N` bodies identical), and 5 Legacy helpers (`transform1..N` identical).

`app/Repositories/Legacy/QueueManagementRepository.php:10-26` — `fetchChunk1` ... `fetchChunkN` are copy-paste clones across all 12 repositories:

```
public function fetchChunk1($tenantId, $filter = null)
{
    $sql = "SELECT * FROM ivr_queue_managements WHERE tenant_id = " . (int)
$tenantId;
    if ($filter) {
        $sql .= " AND name LIKE '%" . $filter . "%'"; // SQLi pattern
    }
    return DB::select($sql);
}
public function fetchChunk2($tenantId, $filter = null) { /* identical */ }
```

`resources/js/Pages/Ivr/WhisperCoach/LegacyPass2_84.tsx:1-20` — one of 133 near-identical 392-LOC pages that differ only by a module name and index:

```
function WhisperCoachLegacyPass2_84() {
    return (
        <div>
            <Head title="WhisperCoach legacy pass2 84" />
            <section key={1} style={{ marginBottom: 8, padding: 6, border: '1px solid
#ddd' }}>
                <h2>Section 1 - routing / queue / prompt configuration block</h2>
            </section>
        </div>
    );
}
```

```

    <p>Duplicate enterprise copy for discovery bots - module WhisperCoach
row 1 idx 84</p>
  </section>
  { /* Section 2 ... Section 40, all identical templating */ }

```

Why it matters here: Duplicated files inflate build times, bundle size, review load, and test surface, and guarantee drift over time.

None of these **LegacyPass2** pages are referenced from any route (0 hits in **routes/**), so they are also likely dead weight shipped and maintained for no functional benefit.

Recommended approach:

1. Replace the 133 **LegacyPass2_*.tsx** pages with one data-driven **<LegacyModulePage module={...} idx={...} />** component.
2. Collapse the 12 repositories into one generic **IvrRepository** keyed by table name.
3. Add a duplication gate to CI (**jscpd** for TS, **phpcpd** /PHPMD for PHP) so new clones fail the build.

H8. Ownership Issues MEDIUM

Benchmark: `Top-author ownership of hot files = 43–71%` → falls in the **Moderate** band (Good >80% · Moderate 60–80% · High Risk <60%).

The maintained CRM core shows healthy multi-author ownership (normal for an open-source base), but no single owner dominates the highest-churn files.

- `resources/js/Pages/Contacts/Index` — 14 commits across 5 authors, top author 6/14 ≈ **43%**.
- `routes/web.php` — 7 commits, top author 5/7 ≈ **71%**.

Why it matters here: Diffuse ownership on the busiest files raises coordination cost and inconsistency risk. More importantly, the *opposite* problem hides in the IVR seed: those files have a single author and effectively 100% ownership but **zero tests and zero follow-up churn**, so "clear ownership" there reflects abandonment, not stewardship.

Recommended approach:

1. Assign explicit CODEOWNERS for `resources/js/Pages/Contacts`, `Organizations`, and `Users`.
2. Assign an owner (or a deprecation decision) for the entire `app/Legacy/**` and `resources/js/Pages/Ivr/**` surface before it accretes more clones.

3 files affected.

File	Line(s)	Issue	Action
<code>routes/api.php</code>	—	High-churn routing/config file with diffuse authorship	Assign CODEOWNERS and require owner review on change
<code>routes/console.php</code>	—	High-churn routing/config file with diffuse authorship	Assign CODEOWNERS and require owner review on change
<code>routes/web.php</code>	—	High-churn routing/config file with diffuse authorship	Assign CODEOWNERS and require owner review on change

H9. Global Mutable State (additional) HIGH

Benchmark: `Shared mutable static holders = 12` → falls in the **High Risk** band (Good 0 · Moderate 1–3 · High Risk >3).

Every God service exposes a process-wide mutable cache and a hard-coded credential as class state.

`app/Legacy/Services/QueueManagementGodService.php:8-11` :

```
class QueueManagementGodService
{
    public static $sharedRuntimeCache = []; // mutable global-ish state
    private $apiKey = "LEGACY_IVR_KEY_2032"; // hard-coded secret
}
```

Why it matters here: `public static $sharedRuntimeCache` is shared across every request in a long-running worker (Octane/queue), so one tenant's payload can leak into another's request or be overwritten mid-flight — a correctness and isolation hazard that is invisible in single-request testing.

Recommended approach:

1. Replace the static cache with request-scoped state or Laravel's `Cache` /container-bound singleton keyed per tenant.
2. Move the credential to config/environment (cross-referenced by the Security agent).

12 files affected.

File	Line(s)	Issue	Action
<code>app/Legacy/Services/AgentDeskGodService.php</code>	10	Process-wide mutable static state shared across requests/tenants	Replace with request-scoped or per-tenant cache; remove static mutability
<code>app/Legacy/Services/BusinessHoursGodService.php</code>	10	Process-wide mutable static state shared across requests/tenants	Replace with request-scoped or per-tenant cache; remove static mutability

<code>app/Legacy/Services/PromptLibraryGodService.php</code>	10	Process-wide mutable static state shared across requests/tenants	Replace with request-scoped or per-tenant cache; remove static mutability
<code>app/Legacy/Services/QueueManagementGodService.php</code>	10	Process-wide mutable static state shared across requests/tenants	Replace with request-scoped or per-tenant cache; remove static mutability

H10. Dynamic Variable Creation via `extract()` (additional) HIGH

Benchmark: `extract()` / `dynamic-var` uses $\approx 4,940$ → falls in the **High Risk** band (Good 0 · Moderate 1–50 · High Risk >50).

`extract($payload)` is used pervasively to hydrate local variables from arbitrary array input.

`app/Legacy/Services/QueueManagementGodService.php:13-17` :

```
public function orchestrateQueueManagementWorkflow1($payload)
{
    extract($payload); // unsafe
    self::$sharedRuntimeCache[$tenant_id ?? 1] = $payload;
```

Why it matters here: `extract()` on request-derived data makes every downstream variable's origin invisible, defeats static analysis (PHPStan/Larastan cannot track types), and can clobber existing locals — a maintainability and safety problem at ~4,940 call sites.

Recommended approach:

1. Replace `extract($payload)` with explicit `$payload['tenant_id']` access or a typed DTO.
2. Add a PHPStan/PHPMD rule banning `extract()` to prevent regressions.

92 files affected.

Not observed (rated Good): H1 — max per-method cyclomatic complexity is ~8 (`IvrHubController::loadStats`), all other methods have ≤3 branches. H3 — largest single function is ~22 LOC (`handleStore`); no function exceeds 50 LOC. H6 — top-churn file changed ~0.35×/month over 78 months; no file is a churn hotspot. H7 — the most-fixed file has 3 fix commits (top of the Good band).

2.3 Code Churn & Stability Evidence

Git history was available: **124 commits, Jan 2020 → Jul 2026, 20 distinct authors**. The high-risk IVR surface was introduced in a **single bulk commit** (`e60dc88` added `IVR dashboard`), so it carries near-zero churn — low churn here signals *unexercised* code, not stability.

Top files by all-time churn (commit frequency):

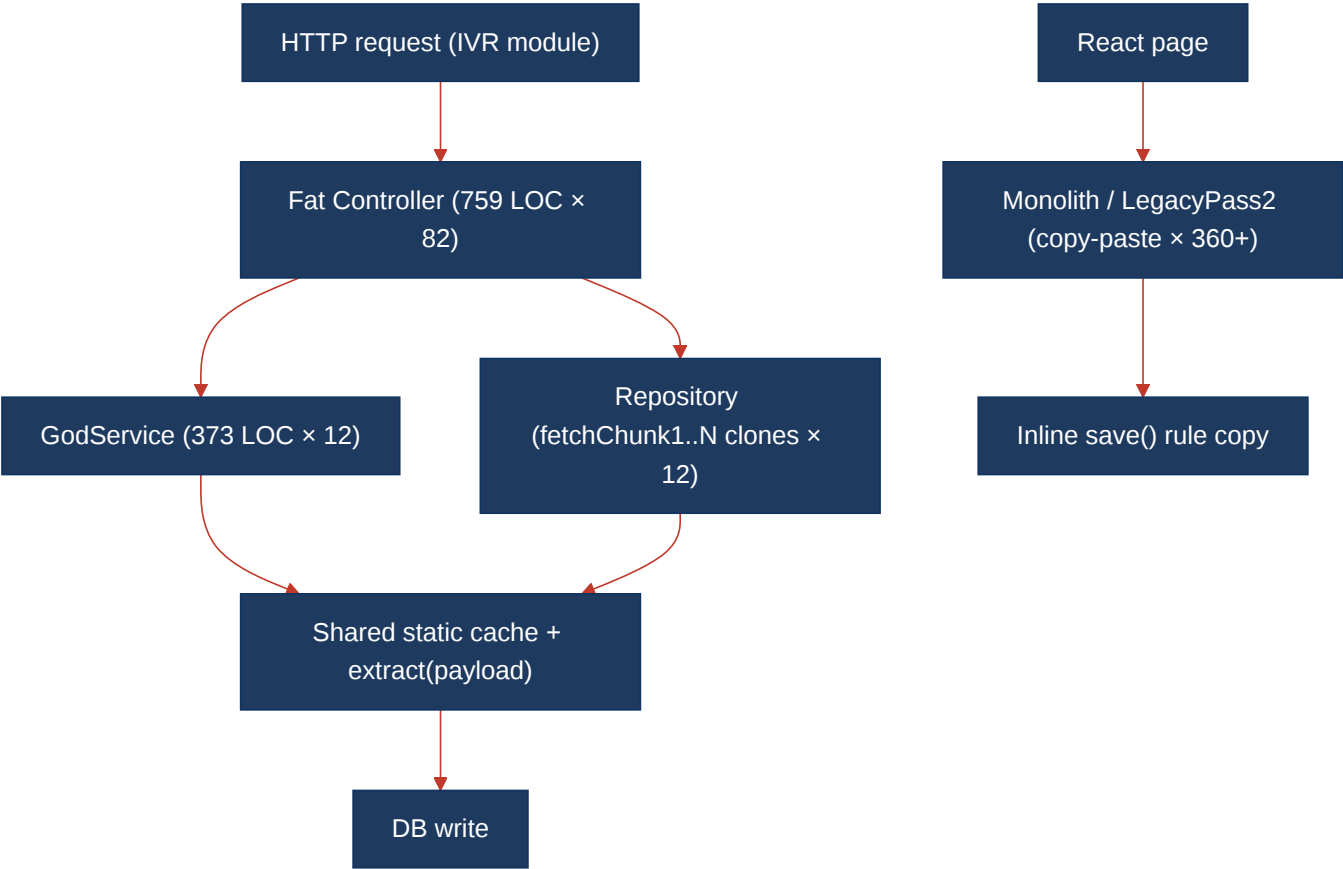

File	Commits	Note
<code>composer.lock</code>	27	dependency lockfile (expected)
<code>composer.json</code>	24	dependency manifest
<code>package-lock.json</code>	23	dependency lockfile
<code>package.json</code>	22	dependency manifest
<code>resources/js/Pages/Users/Edit</code>	20	maintained CRM core
<code>resources/js/Pages/Organizations/Index</code>	20	maintained CRM core
<code>resources/js/Pages/Contacts/Index</code>	20	maintained CRM core
<code>routes/web.php</code>	14	routing

Defect-fix frequency: 25 commits in history match `fix|bug|hotfix|patch`. Hottest maintained file `Contacts/Index` = 3 fix commits (Good band).

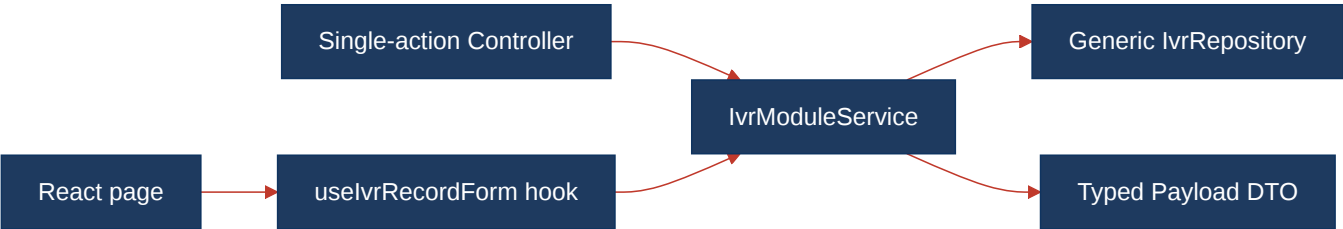

Ownership (distinct authors on hot files): `Contacts/Index` — 5 authors, top 43%; `routes/web.php` — 3 authors, top 71%. The entire `app/Legacy/**` and `resources/js/Pages/Ivr/**` surface is single-author with no follow-up commits and no tests.

2.4 Diagrams

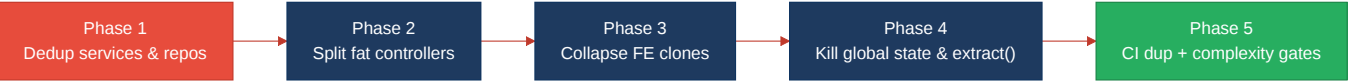

Complexity / duplication hotspot (current shape)

Refactored target structure

Improvement roadmap

2.5 Actions Required

Hotspot	Action	Rating	Priority
H4 Business Logic Duplication	Consolidate per-module workflows into one <code>IvrModuleService</code> + a shared <code>useIvrRecordForm</code> hook	HIGH RISK	CRITICAL
H5 Duplicate Code (general)	Replace 133 <code>LegacyPass2</code> pages / 8 formatter clones / 12 repos with data-driven components; add <code>jscpd</code> / <code>phpcpd</code> CI gate	HIGH RISK	CRITICAL

H2 Large Classes	Split 82 fat IVR controllers into single-action controllers + services; collapse >1,000-LOC formatter modules	HIGH RISK	HIGH
H9 Global Mutable State	Replace <code>public static \$sharedRuntimeCache</code> with request-scoped/per-tenant cache in all 12 God services	HIGH RISK	HIGH
H10 Dynamic Variable Creation	Replace ~4,940 <code>extract(\$payload)</code> calls with explicit access/DTOs; ban <code>extract()</code> via PHPStan	HIGH RISK	HIGH
H8 Ownership Issues	Add CODEOWNERS for CRM core and assign an owner/deprecation decision for <code>Legacy/**</code> and <code>Pages/Ivr/**</code>	MODERATE	MEDIUM

2.6 Expected Outcomes

- **Lower maintenance cost:** consolidating duplicated workflows and files removes an estimated ~60% of redundant code, so each business-rule change is made once instead of across 12–230 sites.
- **Fewer regressions:** a single shared service + form hook eliminates the "fixed here but not there" defect class that dominates the IVR surface today.
- **Faster, safer builds:** deleting 8 oversized formatter modules and ~360 clone components shrinks the frontend bundle and CI time; a duplication gate prevents new clones.
- **Correctness & isolation:** removing shared static state and `extract()` closes cross-tenant leakage and restores static-analysis (Larastan) coverage.
- **Clearer ownership:** CODEOWNERS on the maintained core and an explicit decision on the Legacy/IVR surface reduce coordination overhead and stop dead code from accreting.
