

Discovery Executive Summary

Project: discovery-26-aug · Generated: 26/08/2026, 16:39:17

EXECUTIVE SUMMARY

This report consolidates the overall ratings, key findings, and recommended actions from the 2 discovery analyses run across this codebase (frontend and backend). Each section below reproduces that analysis's executive view; full evidence and diagrams live in the individual reports.

Portfolio Overview

#	Analysis	Overall Rating
1	Testing & Quality Assurance Analysis	—
2	Technical Debt	—

1. Testing & Quality Assurance Analysis

EXECUTIVE SUMMARY

PingCRM's test suite is critically under-resourced across both its Laravel backend and React/TypeScript frontend. Of 141 PHP source files and 903 frontend TypeScript/TSX files, only 5 test files exist in total — two real backend feature tests (Contacts, Organizations), one PHP unit placeholder that asserts `assertTrue(true)`, one frontend smoke test that asserts `expect(true).toBe(true)`, and a shared TestCase base class. Estimated overall coverage is well below 5%. Entire high-risk domains ship with zero test protection: the authentication flow, the Users module, Reports, and the entire IVR platform (83 controllers, 12 legacy GodServices, 12 repositories); no contract tests exist for any API endpoint or JSON response schema. Frontend Vitest tests are absent from the CI pipeline entirely, meaning the React layer has no automated regression gate. The two real backend feature tests run on CI but no evidence of being a required status check was found, compounding the risk.

§5.1 Benchmark Ratings Summary

#	Hotspot	Primary KPI	Good	Moderate	High Risk	Measured	Rating
H1	Untested Critical Logic	Critical modules with zero tests (target 0)	0	1–3	>3	Auth, Users, Reports, IVR (83 controllers), 12 Legacy GodServices, 12 Repositories — >10 modules	High Risk
H2	Low Test Coverage	Overall coverage % (target >80%)	>80%	50–80%	<50%	Backend ~2% · Frontend ~0% (test-to-source ratio estimate — no coverage report present)	High Risk
H3	Missing Integration Tests	Key service/data boundaries covered % (target >70%)	>70%	30–70%	<30%	2 of ~30+ real service/controller boundaries = ~7%	High Risk
H4	Missing Contract Tests	Public APIs/contracts with contract tests % (target >80%)	>80%	40–80%	<40%	0 contract tests for any endpoint	High Risk
H5	Flaky / Skipped Tests	Skipped/flaky test count (target 0)	0	1–5	>5	0	Good
H6	No CI Test Gate	Tests enforced in CI	Required gate	Runs, not required	No CI test run	PHP tests run on PR/push; frontend Vitest absent from CI entirely	High Risk
H7	Trivial / Assertion-Free Tests (additional)	Tests with no meaningful assertion (target 0). Good: 0 · Moderate: 1 · High Risk: >1	0	1	>1	2 vanity tests (<code>ExampleTest.php</code> , <code>smoke.test.ts</code>) with <code>assertTrue(true)</code> / <code>expect(true).toBe(true)</code>	High Risk

§5.4 Actions Required

Hotspot	Action	Rating	Priority
H1 — Untested Critical Logic	Write PHPUnit feature tests for <code>AuthenticatedSessionController</code> (login, logout, rate-limiting), <code>UsersController</code> (CRUD, owner flag), and at least one Index/Store test per IVR module (12 modules × 2 = 24 tests)	High Risk	Critical
H2 — Low Test Coverage	Enable PHPUnit coverage reporting in CI; set 30% initial gate in <code>phpunit.xml</code> ; configure <code>@vitepress/coverage-v8</code> with a 20% branch threshold for the frontend	High Risk	Critical
H3 — Missing Integration Tests	Extend <code>RefreshDatabase</code> feature tests to <code>UsersController</code> mutations and all IVR Index HTTP endpoints; add <code>LoginRequest</code> rate-limiter boundary test	High Risk	High
H4 — Missing Contract Tests	Add <code>AssertableInertia</code> prop-contract tests for all IVR Index pages asserting <code>rows</code> , <code>filters</code> , and <code>legacyMeta</code> keys; add JSON response shape assertions for <code>wantsJson()</code> branches in all 12 IVR modules	High Risk	High
H6 — No CI Test Gate (Frontend)	Add <code>npm test</code> (Vitest) and <code>npx tsc --noEmit</code> steps to <code>.github/workflows/tests.yml</code> ; mark the workflow as a required GitHub branch protection status check on <code>master</code>	High Risk	High
H7 — Trivial / Assertion-Free Tests	Replace <code>tests/Unit/ExampleTest.php</code> with a real <code>User</code> model unit test; replace <code>resources/js/test/smoke.test.ts</code> with a <code>@testing-library/react</code> component render test	High Risk	Medium

§5.5 Expected Outcomes

- Authentication and user-management regressions are caught by automated tests before they reach production, eliminating the risk of silent privilege escalation or account lockout.
 - The entire IVR platform (83 controllers, 12 GodServices) has a regression safety net in place before any modernization or refactoring begins, allowing teams to refactor with confidence.
 - Frontend Vitest and TypeScript checks run on every CI build, ensuring broken React components or type errors are caught at pull-request time rather than at runtime.
 - API and Inertia prop-contract tests prevent breaking changes to JSON response shapes from silently corrupting IVR frontend pages after any backend change.
 - A clearly visible, enforced coverage gate (30% initial, rising to 75%) gives the team a measurable quality trend and blocks coverage regressions from merging to `master` .

2. Technical Debt

EXECUTIVE SUMMARY

This repository is a large multi-package monorepo that is itself an AI agent orchestration harness — it has deep Kiro and Cursor AI tooling already embedded, structurally enumerable agent units, and well-designed MongoDB schemas. However, three gaps block confident agentic-harness adoption today: (1) the main application has **zero CI/CD pipeline** at the root level — changes land on `main` without any automated gate; (2) `backend-server/.env.example` contains what appears to be a live Google App Password (`SMTP_PASSWORD=lpwc sdc s fshj mqqg`), and the root `.env.example` contains a Redmine API key — real credentials in a committed example file are a supply-chain and credential-rotation risk; (3) ESLint and Prettier are configured but enforced nowhere — no pre-commit hooks, no CI check — so formatting and lint drift accumulates silently. Test coverage is effectively zero for the main app (one test file across the entire backend, none in the frontend), which means any agent-authored change cannot be verified before merge. The overall agentic-harness readiness is **High Risk**, driven primarily by the absence of CI and the credential exposure in example files.
