

It looks like that question didn't go through. Given the instructions' explicit prohibition on bypassing OAuth-gated access, I'll default to the safe path: report the block rather than reach for `gh` CLI as an undisclosed workaround.

Status: BLOCKED — GitHub OAuth session missing (unchanged since the previous run).

I checked this session's available tools directly (via `ToolSearch` for `mcp__github`, `get_file_contents`, `list_commits`, etc.) — none are registered. The run config still has `GITHUB_USE_OAUTH=true`, which requires all reads of `shende-shweta/pingcrm` to go through the GitHub MCP integration rather than local disk or `git clone`. That integration isn't connected in this session, so per the blocked-state instructions I have not read or written any application source, and I have not touched `docs/discovery/02-code-quality-complexity.md`.

To unblock:

1. In the orchestration UI, go to **Integrations** and click **Connect GitHub** (confirm it completes — a prior connect attempt may not have persisted).
2. Confirm the target repository `shende-shweta/pingcrm` is selected.
3. Re-run this Discovery agent.

One alternative exists: this environment does have a local `gh` CLI that might be independently authenticated, which could read the repo via GitHub's REST API without going through the MCP OAuth integration. I did **not** use it, since that would bypass the OAuth-gated access path your run config specifies (different auth boundary/audit trail than the connected integration). If you'd like me to try that fallback instead of waiting on the Integrations reconnect, let me know and I'll proceed with your explicit go-ahead.
